## PT23/PT23L

INVERTED BUCKET STEAM TRAPS (CAST IRON)

## DESCRIPTION:

Inverted bucket steam trap with integral strainer and all stainless steel internals. Best suited for equipment drains with medium to heavy condensate loads. Intermittent operation.

## FEATURES:

The inverted bucket arrangement operates on the density difference between steam and water, giving a cyclic operation for discharge of the accumulated condensate.

High condensate handling capacities even at low pressure, permit the use of small trap sizes to suit many applications.

The valve and valve seat are hardened by a special induction hardening process to withstand continuous prolonged operation.

Perfect shut-off, no steam loss.

## SIZES:

NPS $1 / 2,3 / 4,1$

## CONNECTIONS:

Screwed (NPT/BSPT/BSP)

## LIMITING CONDITIONS:

| PMA: Max. allowable pressure | 250 psig |
| :--- | :---: |
| TMA: Max. allowable temp. | $4^{\circ} \mathrm{F}$ |

Maximum operating back pressure at the outlet should not exceed $90 \%$ of the inlet pressure.
Minimum diff. pressure for
satisfactory operation

Cold hydro test pressure

## INSTALLATION:

The trap should be fitted with the inlet and outlet connections horizontally in-line. Correct fitment with body vertical is essential for easy movement of the bucket. The bypass arrangement should be above the level of the trap.

Full port isolation valves should be fitted before and after the trap, to be used when the trap has to be opened for maintenance.

## MAINTENANCE:

This product can be maintained inline without disturbing the piping connections. Ensure that the trap is isolated upstream \& downstream - before attempting to dismantle it. It is recommended that the trap be opened periodically and the internals inspected for wear, damage, and dirt. All worn or damaged parts should be replaced with new spares. A full new internal kit comprising of the valve pin, valve seat, bracket and lever, should be replaced as a set. The bucket vent hole should be cleaned. The strainer screen should be removed and cleaned regularly.

## IMPORTANT:

Ensure that the trap is primed by opening the inlet valve only a crack at start-up, allowing water to fill the trap before the steam enters. The inlet valve should be opened fully only after the trap is filled with water.

The trap should be installed as close as possible to the equipment to be drained. For new pipelines, ensure that the lines are properly flushed, prior to fitting the trap.

MATERIAL:

| NO. | PART | MATERIAL | QTY. |

[^0]
[^0]:    Guidelines on use of Capacity Chart

    - Go the to differential pressure column corresponding to or slightly higher than, but not less than the operating differential pressure at which the trap is to be used. Move vertically downwards and select a suitable model and orifice size.
    - The selected capacity should be equal to or higher than the condensate load after including a safety factor of 2 to 3 . Oversizing is not recommended.
    - Example - Operating conditions $=1$ ) Inlet press. 57 psig II) Back press. 14 psig III) Condensate load 440 Ibs/hr. IV) Safety factor 2.

    Model Selected: PT 23-1" • Orifice Size : 5/32" • Capacity 1320 Ibs/hr @ a diff. press. of 43 psi.
